### 3. COMPREHENSION PASSAGE

Read the following passage and answer the questions below:

The explosion of a star is an awesome event. The most violent of these cataclysms, which produce supernovae, probably destroys a star completely. Within our galaxy of roughly 100 billion stars the last supernova was observed in 1604. Much smaller explosions, however, occur quite frequently, giving rise to what astronomers call novae and dwarf novae. If the exploding star is in a nearby part of the galaxy, it may create a "new star" that was not previously visible to the naked eye. The two stars are so close together that they revolve around a point that lies barely outside the surface of the larger star. As a result, the period of rotation is usually only a few hours, and their velocities range upward to within a two-hundredth of the speed of light.

### (COMPREHENSION QUESTIONS)

1. The production of supernova

- A. occurs frequently
- B. occurs 25 times in 1 year
- C. occurred in 1946
- D. occurred in 1604

**2. The period of rotation is usually:**

- A. Two hundred of speed of light
- B. Within range of two hundredth speed of light
- C. Velocity is not more than two hundredth
- D. Velocities range upward to within a two-hundredth of the speed of light

**4. CHOOSE APPROPRIATE ANALOGY.**

**1. Bacteria : Decomposition ::**

- A. Antibiotic : Injection
- B. Oxygen : Treatment
- C. Volcano : Eruption
- D. Yeast: Fermentation

**2. Leaf : Oak ::**
